

Keeping your infrastructure secure and protected against cyberthreats is a complex and constantly evolving undertaking. If you have a small IT team, or if you have multiple locations, it can be challenging to keep up with all the upgrades, patches, and troubleshooting—let alone alerts and mitigation—and still have time left over for all your other responsibilities. Let BCM One secure your infrastructure and proactively detect and respond to cyberattacks, so you can focus on strategic business initiatives.

Your infrastructure, secured by BCM One.

Unified Threat Management (UTM) Firewall Service

Your firewall is your first line of defense—but only when it's correctly configured, kept up to date and patched, and continually monitored in compliance with regulatory standards. Our firewall services include critical security capabilities such as antivirus/phishing, IDS/IPS, VPN, and content filtering.

Managed WiFi

Employees and customers expect WiFi to be fast and secure. Our secure managed WiFi service ensures access to reliable, scalable, and secure wireless internet—and provides visibility into your network users, their devices, and their applications. The service includes identity-based firewall to segment your network and enforce policies for different classes of users, application visibility and control, mobility support, RF optimizations, Bluetooth-enabled beacon and other active customer engagement applications, and location analytics and mobile engagement metrics.

Managed Switching

We isolate the data traffic based on groups—such as users, guests, backups, management, and servers—to not only give you a better way to control data traffic, but also provide strong protection for the whole network.

Managed Detection and Response

We provide active threat monitoring for compliance and infrastructure management—which includes collecting, aggregating, and normalizing log data from servers, endpoints, applications, and security devices—keeping vigilant watch over the security of your IT environment. We define, implement, and update security rules; run targeted threat-hunting sequences to trace anomalies; examine alerts to separate true concerns from false positives; and address and appropriately escalate any threats in real time.

Secure and Redundant Connectivity for Point-of-Sale Applications

Keep critical PoS applications and devices up and running with isolation, security, and redundancy. This secure, PCI-compliant solution protects standalone payment terminals, applies security policies for broadband and cellular connectivity, eliminates manual backup processes and lost sales, and reduces excess dial lines and slow connections.

PCI 1-2-3

If you process, store, or transmit credit card data, you must comply with PCI DSS. Our PCI 1-2-3 solution is a powerful online tool that provides a suite of services to analyze, remediate, and validate PCI compliance, including a self-assessment questionnaire, external vulnerability scans with detailed instructions for correcting any identified problems, a set of custom security policy templates, on-demand security training, and more.

BCM One's Security Solutions:

- Secure your infrastructure with compliant services
- Bring cybersecurity expertise and technical know-how to act as an extension of your team
- Leverage cloud-based solutions that are implemented and updated remotely
- Provide access to ongoing, easy-to-understand reports
